Environment-behavior Studies and Design Research.

Dr. Joost van Andel
Eindhoven University of Technology
Department of Philosophy and Social Sciences

1. DESCRIPTION OF THE RESEARCH GROUP

Environment-behavior studies has been one of the main topics in research and teaching at the Department of Philosophy and Social Sciences, TUE, from about 1980. We are mainly interested in the interaction between users and their built or natural environment. Interest in design processes comes therefore through the fact that most environments are designed by architects or environmental planners. More specifically we have always been interested in communicating with designers about the results of environment-behavior research. Hamel has started the first substantial research project on this subject, which eventually has led to his dissertation in 1990 about a cognitive psychological description of the architectural design process (Hamel, 1990). Using protocol analysis of design activities of a number of practicing architects, Hamel was able to test empirically his model of the architectural design process.

From then on essentially two lines of research were followed:

On the one hand the use of Alexander’s patterns as a form of communicating research results to architects in a number of practical studies by staff members and/or MA-students, such as on nursing homes (van Wagenberg, Dellaert, Waalwijk, 1989), the role of doorsteps in housing (van Andel, Bruls, Jaartsveld, 1990), environments for users with cognitive disfunctions (van Vree, van Andel, Venselaar, 1992), houses for the elderly (Christmas, 1994), environments for visually impaired elderly (de Kort, 1993), and offices (van Dorst, 1992). Most of these studies were done in cooperation with colleagues from Bax’s Design Methods Group at the Department of Architecture, TUE, especially with Boekholt and Dinjens, who maintains a growing database of Alexander-type patterns on a variety of issues and environments. At present this database contains about 1900 different patterns from about 50 different sources.

On the other hand we have focused on the role of both visual and graphical information, and on the role of computer support in transferring information from research to designers, culminating in the use of hypermedia systems. A major study on this subject is the recently completed PhD work of de Vries (1994) on the cognitive aspects of designing as problem solving and the role of external information with different structures. The goal of the designer in using the information system happened to be important, especially distinguishing browsing (for new information) and searching (for specific answers). The structure of the information was studied as well, comparing hierarchical, network, and mixed structures. (See also: de Vries, 1993; de Vries, van Andel, de Jong, 1992a and 1992b;
and de Vries, de Jong & van Andel, in preparation). Related to this subject two MA-
theses were finished, one of which was about hypertext-based information on the
environmental impact of different materials and procedures in the design of
consumer products (Bor, 1992). The other MA-project studied the role of image-
based information, using mainly pictures with minimal textual information, in
communicating with architectural designers of children’s playgrounds (Burger,

In the meantime, collaboration with the Department of Industrial Design,
TU Delft resulted in a study of the role of user-centered design information in
relation to design projects at the department. Here again the role of visually
presented information was studied together with the phenomenon of “design-
fixation” (Christiaans & van Andel, 1993). Recently, the results of a study in
cooperation with the Department of Architecture, UC Berkeley have been published
(van Andel, 1994). In this study the effects of three types of presentation of a
behavior mapping study were compared. Students completed the task of
redesigning a school playground with the use of research data either in graphical, or
in a table, or in a combined form. Finally, the combination and interaction of
researching and designing were studied introspectively by a MA student. His
analysis shows clearly both the differences and the mutual reinforcement of these
two activities (Boer, 1994; Boer & van Andel, in preparation).

2. OBJECTIVES AND INTERESTS

To summarize the main objective of our group in design research:
To study the use of a specific type of information (user related knowledge) and the
role of the form of presentation (through patterns; using graphical information and
visual images; computer supported through hypermedia) in a specific design
context (environmental, architectural, and product design).
3. ACTIVITIES

Some of our current and planned activities are:
- Staff- and MA-students’ research on environment-behavior concepts that are relevant and useful for architectural designers such as affordances and patterns.
- Joint research project with Dept. of Product Design, TUDelft on the function of adaptable knowledge bases for designers.
- Possible joint research project with Design Methods Group, Dept. of Architecture, TUE, on the actual use by designers, and the effects of pattern language on the design process and the design product.
- Possible evaluation study in cooperation with Calibre, TUE, on the effects of various computer-based presentation techniques in design practice such as virtual reality; hypermedia, and the WorldWideWeb.
