

Aquaphoneia:
An Interview with TML's
Navid Navab

NAVID NAVAB &
HILARY BERGEN
Concordia University

Multidisciplinary composer and media alchemist Navid Navab and his team at the Topological Media Lab (Montreal) presented *Aquaphoneia*, a sound installation which “transmutes voice into water and water into air.

HB: The theme of the 2016 Ars Electronica Festival RADICAL ATOMS – and the alchemists of our time is very close to the Topological Media Lab’s mission: transmutation and alchemy on the philosophical and phenomenological level seem to be at the centre of your research and methodology at the lab. For Aquaphoneia, can you expand on alchemy and specifically on how this art piece stands out from your past work? How did alchemical thought process and production techniques come up in the process of the piece?

NN: When the 2016 theme for Ars Electronica Festival was announced I was happily surprised and thought: Finally shit is coming to light at a much larger scale. Yes please! Can we reverse the still prominent European Modernism’s separations – between the conceptual and the material, the precise and the messy, the sciences and the arts – and go back to the holistic richness of alchemical matter? This transition that we are currently experiencing calls for a shift away from representational technologies: from interfaces to stuff, from objects to fields of matter-in-process, from fixed concepts to processes that enact concepts.

For over a decade, we as alchemists have been engaging with “bodies and materials that are always suffused with ethical, vital and material power.” The Topological Media Lab [TML] is occupied by people who are living to fuse and confuse, ready to unlearn the apparent practicality of isolated disciplines, while playfully improvising new pathways to understanding potential futures. The TML hosts an array of projects for thinking-feeling through poetry-infused-matter and breathing life into static forms – which to me is an effortlessly artistic process, and all the while inseparable from a rigorously philosophical or scientific one. Even though it might take decades for the kinds of computational-materials that we are envisioning today to be engineered from ground up at an atomic level, with what is possible today, we explore how the messy stuff of the world could become computationally charged with the potential for play: sounding, dancing, and co-performing new ways of living with or without us. *Aquaphoneia* comes out of this rich ecology of experiments.

Figure 1 Photograph of Aquaphoneia experience in action.

In Aquaphoneia, voice and water become irreversibly fused. The installation listens to the visitors, and transmutes their utterances into aqueous voice, which then is further enriched and purified through alchemical processes. To fully realize this liquid dream, we went to great lengths in order to fuse the messy behaviour of matter flowing throughout the installation with meticulously correlated and localized sonic behaviour. For example, the temporal texture of boiling liquid in one chamber is perceptually inseparable from the spectral entropy of simmering voices which then evaporate into a cloud of spectral mist. All of this dynamic activity is finely localized: the sounds acoustically emit exactly from where the action occurs, rather than spatially schizophrenic loudspeakers elsewhere.

On another hand, our material-computational-centric approach led to a tough yet rewarding meditation on control and process. As a composer I had to let go of all desires for immediate control over sounds and surrender important rhythmical and compositional decisions to messy material processes. As Duchamp puts it, "alchemy is a kind of philosophy: a kind of thinking that leads to a way of understanding." For us, in the process of creating Aquaphoneia, essentially what had to be understood and then given up was our attachment to our far-too-human notions of time and tempo. Instead we embraced and worked within the infinitely rich and pluri-textural tempi of matter. Technically and compositionally this meant that most of our focus

had to be placed on merging the continuous richness of material processes with our computational processes through an array of techniques: temporal pattern following, audio-mosaicing, continuous tracking of fields of activity using computer vision and acoustic sensing techniques in order to synthesize highly correlated sonic morphologies, careful integration of structure-born-sound, etc. We were able to co-articulate compositions by constraining material processes sculpturally, and then letting the liquid voice and the laws of thermodynamics do their thing.

One of the first elements that we notice in the installation is the brass horn connected to an old Edison sound recording machine, that now turns voice into liquid instead of wax cylinders! In fact, it came from an Edison talking machine. You repurpose an authentic artifact, you do not fall into the trap of nostalgia, and neither into the role of collector, but you embrace innovation with a dynamic approach which excavates past media technologies in order to understand or surpass contemporary audio technologies. Where does the use of the Edison horn come from and how does it speak to your relationship with the superposition of history?

The history of sound reproduction involves transforming audible pressure patterns or sound energy into solid matter and vice versa. The historic Edison recording machines gathered sound energy to etch pressure patterns onto tinfoil wrapped around a cylindrical drum. Sound waves, focussed at the narrow end of the horn, caused a small diaphragm to vibrate, which in turn caused a miniature steel-blade stylus to move and emboss grooves in the cylinder. The tin foil would later on be replaced by wax cylinders, vinyl disks and eventually digital encoding.

Aquaphoneia engages the intimately recursive relationship between sounding technologies and material transmutations. Our digital audio workstations are in fact an inclusive part of this history, this endless chain of analog transmutation between energy and matter. Under the fiction of the digital there is always the murmur of electrons and of matter-energy fields in physical transmutation. As J. Fragier writes on an early book by Nam June Paik: "The digital is the analog correspondence of the alchemists' formula for gold." Well, yes. The digital revolution has allowed us to shape, compute, purify, and sculpt sounds like never before... but then often at the hefty cost of a disembodiment process, with interfaces that are linked to sounds only through layers upon layers of representation, far detached from resonating bodies and the sexy flux of sounding matter.

Aquaphoneia playfully juxtaposes material-computational histories of talking machines within an imaginary assemblage: sounds are fully materialized and messed with tangibly within an immediate medium very much like clay or water or perhaps more like a yet to be realized alchemico-sonic-matter. This odd assemblage orchestrates liquid sounds leveraging intuitive worldly notions – such as freezing, melting, dripping, swishing, boiling, splashing, whirling, vaporizing – and in the process borrows alchemical tactics expanding across material sciences, applied phenomenology, metaphysics, expanded materiology, and the arts. Aquaphoneia’s alchemical chambers set these materials, metaphors, and forces into play against one another. After the initial ritual of offering one’s voice to the assemblage, the aqueous voice starts performing for and with itself and human visitors have the opportunity to watch and participate as they we would when encountering the unpredictable order of an enchanted forest river.

It is also noteworthy that the horn resembles a black hole. The edge of the horn acts like an event horizon, separating sounds from their source-context. Sounds, once having passed the acousmatic event horizon, cannot return to the world that they once knew. Voices leaving the body of their human or non-human speaker, fall into the narrow depths of the horn, and are squeezed into spatio-temporal infinity. Disembodied voices, are immediately reborn again with a new liquid body that flows through alchemical chambers for sonic and metaphysical purification.

Much of my work deals with the poetics of schizophonia (separation of sound from their sources). Sound reproduction (technologies), from Edison’s talking machines to our current systems, transcode back and forth between the concrete and acousmatic, situated and abstract, materialized and dematerialized, analogue and digital. Often sounds are encoded into a stiff medium which then may be processed with an interface, eventually decoded, and re-manifested again as sound. Aquaphoneia ends this nervous cycle of separation anxiety and re-attachment by synthesizing a sounding medium capable of contemporary computational powers such as memory, and adaptive spectro-temporal modulation and morphing. To adapt McLuhan, instead of encoding and decoding a presumed message with representational technologies, it enchants the medium!

There is the tendency to think that artwork from Media Labs are stable and high tech. Aquaphoneia uses analog and digital technologies with a Do-It-Yourself (DIY) touch in the aesthetic. Since your lab is multidisciplinary

oriented and influenced by diverse fields of knowledge, can you develop on the DIY dimension in Aquaphoneia under the gaze of Clint Enns – cinematographer in the experimental field of cinema – ‘Adopting a DIY methodology means choosing freedom over convenience’?

Aquaphoneia is a truly eclectic assemblage lost in time. Aquaphoneia’s mixed form reflects its extremely fluid, collaborative and playful creative process. Instead of coming up with a definitive design and executing it industrially, Aquaphoneia’s realization involved a much more playful process, where every little aspect of the installation – materials, sounds, software, electronics, etc – were playfully investigated and messed with. Every little detail matters and every process, undulating back and forth between conception to execution, is an artistic process.

The research-creation process leading to the works that come out of our lab are as critical to us as the final and fully produced art works. This was also true for the Alchemists who through their process were seeking to develop new approaches for understanding the world, relating to matter, and surpassing nature. Our research-creation activities concern experimenting with ethico-aesthetics of collective thinking-making: humans, non-humans, machines, and materials enacting and co-articulating the ever-changing material-social networks of relations which shape them. This DIY art-all-the-way approach, while providing a healthy dose of aesthetic freedom, is also an ethical one: we live with and within our designs and grow with them. That being said, we are not attached to a DIY process in the same way that some maker cultures might be. Sometimes we blindly find and repurpose something that does something cool, complicated, and mysterious and that is fantastic! Sort of like philosophy of media meets cyber dumpster diving meets DIY hacker space meets cutting edge tech research meets miniMax (minimum engineering with maximum impact) meets speculative whatever...

At some point we decided to gather sonic vapour in a glass dome and condense it back into drops, which were then guided to fall into the bottom of the installation. The purified drop of voice – sonic “lapis philosophorum” – was to fall into the depths of the earth beneath and shine upward like sonic gold, connecting heaven and earth. We had to execute this opus magnum inside a very small hole in the base of the installation. The water drop needed to be immediately sensed and sonified, leading to sounds coming out of the same hole, along with synchronized light. You can imagine that if we were relying on “black-boxed” technologies and ready-made techniques then this task would have seemed like a nightmare to design and fabricate.

Figure 2 Case study.

The water drop was to fall all the way to the bottom of the hole where it would be acoustically sensed by a small apparatus that had to be acoustically isolated from everything else. Then the result of the sonification had to be pushed through the very same hole with a high degree of intelligibility and in a way that it would be seamlessly localized. Meanwhile light had to shine through this hole in sync with the sounds but the source of light had to remain hidden. The solution to this technical puzzle came to us effortlessly when playing around with random stuff. We found a hipster product – a little plastic horn – that was made for turning your iPod into a gramophone. Then a speaker was mounted inside of this plastic horn in order to focus sounds towards the end tip of of the horn. The back of the speaker was fully covered with foam and duct tape to stop any sound from escaping anywhere except for where we wanted it to appear.

A small hole was drilled into the brass pipe, in the base of the installation. Our advanced hipster horn-tip-sound-laser-thing was then inserted, allowing crisp sounds to enter the brass hole and emit from it without any visible clues for the perceiver as to where the speaker was hidden. Meanwhile a similar lighting solution was created so that in a very small footprint we can focus, direct, and bounce enough directional light in the brass pipe without ever getting in the way of the water drops.

We had to engage with this sort of detailed fabrication/composition process throughout the whole installation in order to come up with solutions to sense the behaviour of the materials and liquids locally and to manifest them sonically and visually so that there would be no separation from local material behaviours and their computational enchantment. In trying to do so we discovered that more often than not, there was no ready-made solution or technique to rely on and at the same time we didn't have months ahead of us to engage in an abstract design and fabrication process. We had limited hours of collective play time to leverage and to come up with innovative techniques that we didn't even know could exist and that was really fun.
